

Automate delivery of patient surveys.

PatientSurvey enables you to deliver automated surveys to quantify patient satisfaction and to capture patient-reported outcomes.

Digitally capture patient feedback and reported-outcomes.

- Analyze your survey data at the patient, provider, and organizational level with our robust reporting tools
- Automate delivery of surveys based on event triggers that you determine
- Deliver fully customizable surveys based on the needs of your patient population
- Automate patient-reported outcomes, such as PHQ9, KOOS, and HOOS

How it works:

Define Populations

Use extensive query capabilities to define patient populations with as many criterion as you desire. You can utilize the tool to deploy everything from broad satisfaction surveys to your entire population to a survey designed for a very particular group of patients that came in for a specific appointment type and had a certain diagnosis code.

Automate Delivery

The rules-based campaigns enable you to define the events that trigger when a survey is sent, and how the patient is informed that they have received the survey. Patient survey responses can also trigger automated interventions.

Customize Surveys

PatientSurvey has drag and drop design tools that enable you to easily design surveys to meet the needs of your patient population. In addition to flexible aesthetic design, you also have the ability to define response weighting and scorecards.

Reports and Benchmarking

Robust reporting and benchmarking enable you to analyze your survey data at the patient, provider, and organizational level.
